- ❑ **IPC Analysis process:** The 2023 Post Gu IPC AFI/AMN analysis was organized by the IPC Core Group. The IPC Global Support Unit (GSU) provided technical support throughout the analysis.
- ❑ **Participation:** **145** participants drawn from **69** institutions: Government (FGS, FMS and Somaliland) – **54**, Local Universities (UOH, PSU) – **3**, UN (Agencies, Funds and Programmes) – **46**, Local and International NGOs – **30**, and other Technical Partners (FEWS NET, REACH , IPC GSU) – **12**
- ❑ **Unit of analysis:** Livelihoods zones in rural areas, internally displaced population groups and urban populations groups across Somalia
- ❑ **Analysis period** was determined considering seasonality in Somalia:
 - Current: August – September 2023 (Hagaa)
 - Projection: October - December 2023 (Deyr)
- ❑ **Population Analysed** - **16,955,266** total population of Somalia (2023 estimate, Source: OCHA)

Data Sources:

- FSNAU-led countrywide seasonal assessments of rural, urban, and displaced populations
- CARE, UNHCR, FEWS NET/USGS, FSNAU, FAO SWALIM, IGAD/ICPAC, C3S/ECMWF (EU) and NMME (USA), Food Security and Nutrition Clusters, OCHA/WHO/ UNICEF, WFP, SNBS/FGS and ACLED.

- Despite some improvements, current and projected levels of acute food insecurity and malnutrition remain high in Somalia
- During the current analysis period (August-September 2023): **3.7 million people (22%)** of the total analysed population are in Crisis or worse (IPC Phase 3 and higher) and require urgent humanitarian assistance. Out of this total, **0.9 million (5%)** are in IPC Phase 4 (Emergency) and **2.8 million (17%)** are in IPC Phase 3 (Crisis).
- During the projection period (October-December 2023): **4.3 million people (25%)** of the total analysed population face Crisis or worse (IPC Phase 3 and higher) and require urgent humanitarian assistance. Out of this total, over **1 million (6%)** face IPC Phase 4 (Emergency) and **3.3 million (19%)** face IPC Phase 3 (Crisis).
- The increase in the number of people facing Crisis (IPC Phase 3) or worse outcomes from 3.7 million between August-September 2023 to 4.3 million between October to December 2023 is due to a combination of factors, including the adverse impacts of El-Nino related heavy rains and flooding and anticipated decline in the level of humanitarian assistance in the coming months because of funding constraints.
- Approximately **1.5 million** children under the age of five years face acute malnutrition between August 2023- July 2024 (total acute malnutrition burden), including **330,630** who are likely to be severely malnourished.

CURRENT ACUTE FOOD INSECURITY AUGUST-SEPTEMBER 2023

3.7 M

22% of the population

People facing high acute food insecurity (IPC Phase 3 and above) IN NEED OF URGENT ACTION

Phase 5	000 000 People in Catastrophe
Phase 4	919,000 People in Emergency
Phase 3	2,814,000 People in Crisis
Phase 2	5,602,000 People Stressed
Phase 1	7,620,000 People in No Acute Food Insecurity

PROJECTED ACUTE FOOD INSECURITY OCTOBER-DECEMBER 2023

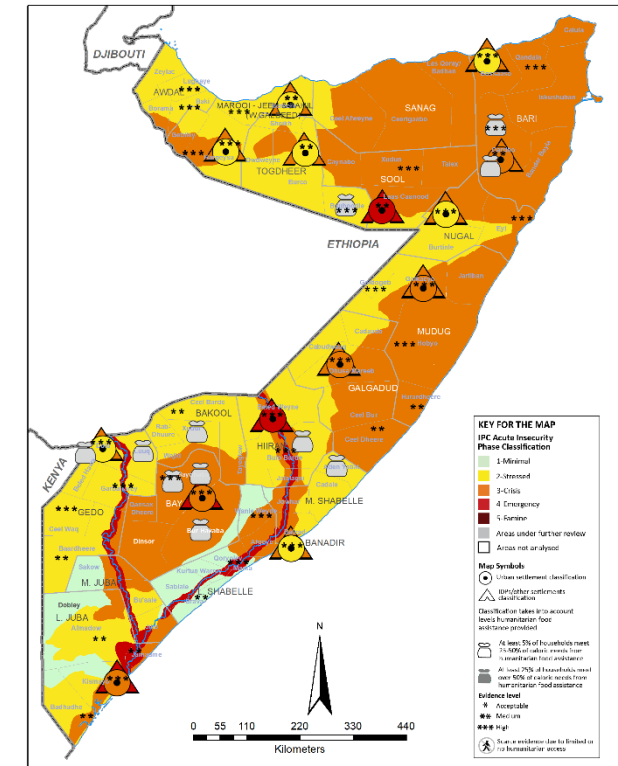

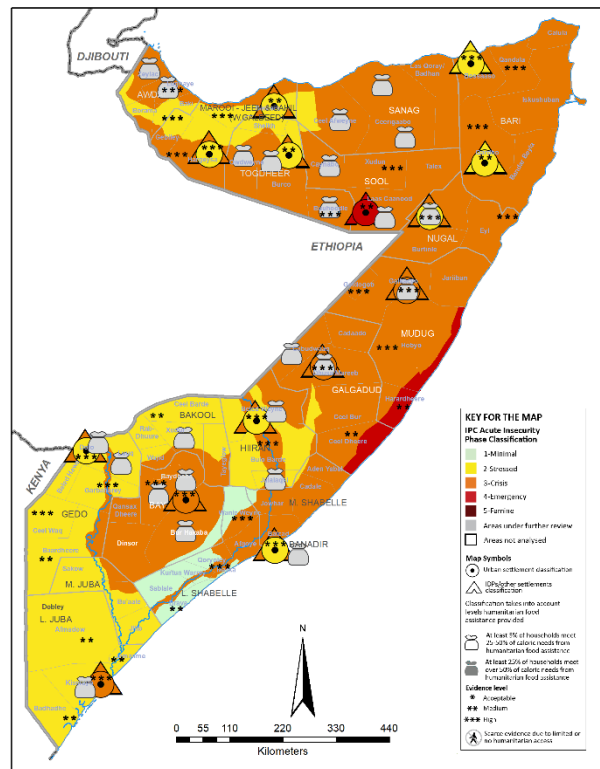

4.3 M

25% of the population

People facing high acute food insecurity (IPC Phase 3 and above) IN NEED OF URGENT ACTION

Phase 5	000 000 People in Catastrophe
Phase 4	1,014,000 People in Emergency
Phase 3	3,281,000 People in Crisis
Phase 2	5,898,000 People Stressed
Phase 1	6,763,000 People in No Acute Food Insecurity

Key Assumptions for IPC AFI and AMN Projection (Oct-Dec 2023)

Climate:

- Driven by El Niño and positive IOD conditions, above average rainfall is likely during the October to December Deyr season in most of the country.
- El Niño rains will likely result in flooding (mainly in riverine and low-lying areas), population displacement, increased risk of disease outbreaks, damage to infrastructure, disrupt access to health facilities and outreach services.
- Above-average rainfall and associated flooding are likely to delay and disrupt cropping activities, damage standing crops, destroy underground cereal stocks in riverine and agropastoral livelihood zones.
- Agricultural employment and income will likely be significantly reduced in flood affected areas.
- Pasture and water availability is expected to improve during the Deyr season, with a positive impact on livestock production and reproduction.

Insecurity/conflict: is likely to persist and adversely affect populations in central and southern Somalia and in Lasaanood

Humanitarian Assistance: Due to funding constraints, availability of vital humanitarian health and nutrition services, cash assistance, food aid, and wash program support will be limited

Food Access:

- Milk availability (mainly from cattle and camel) will remain limited to due to the extended impact of previous droughts.
- Food prices are likely to remain generally stable or increase slightly.
- Market supply disruptions are expected to drive atypical food price increases in flood affected areas.

- The long-term trend in the total number of people in need of urgent humanitarian assistance (Crisis or worse/IPC Phase 3+) in Somalia is increasing
- Current and projected levels of acute food insecurity in Somalia remain high despite a relative improvement of the food security situation compared to 2022

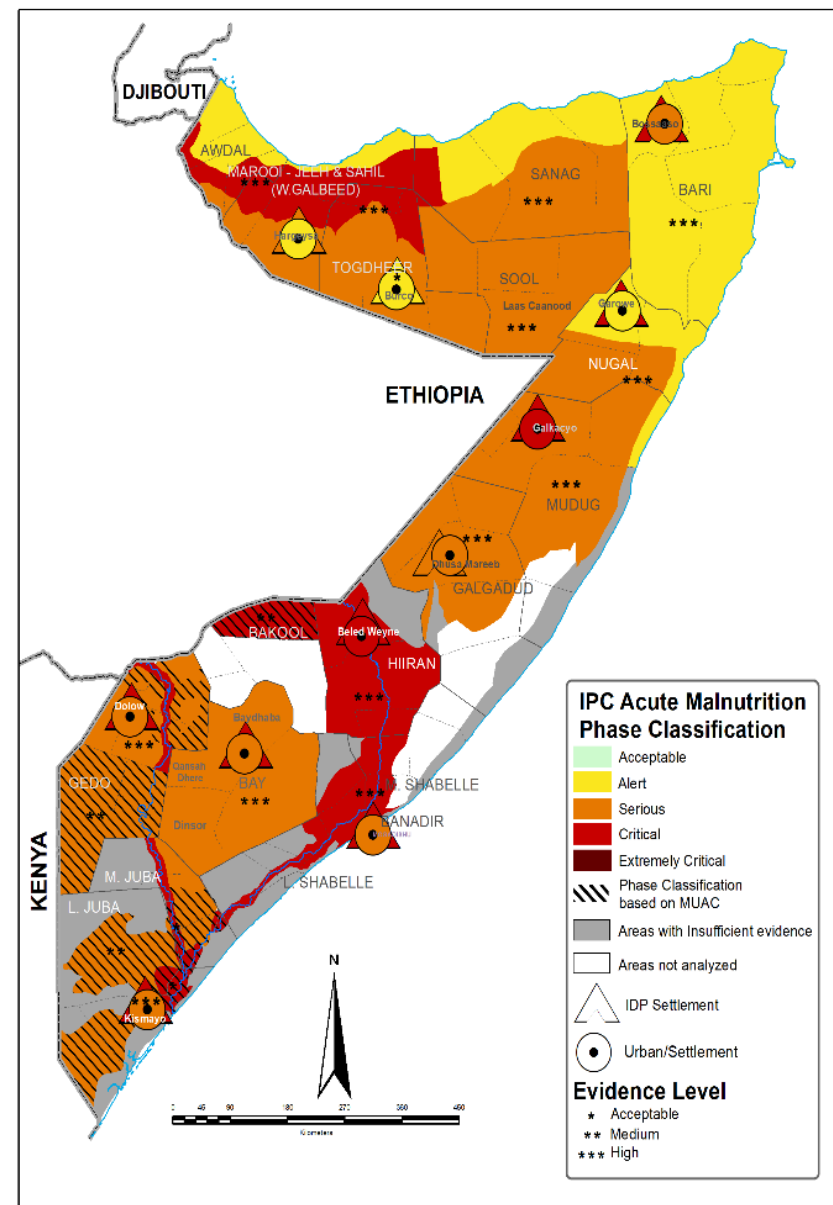

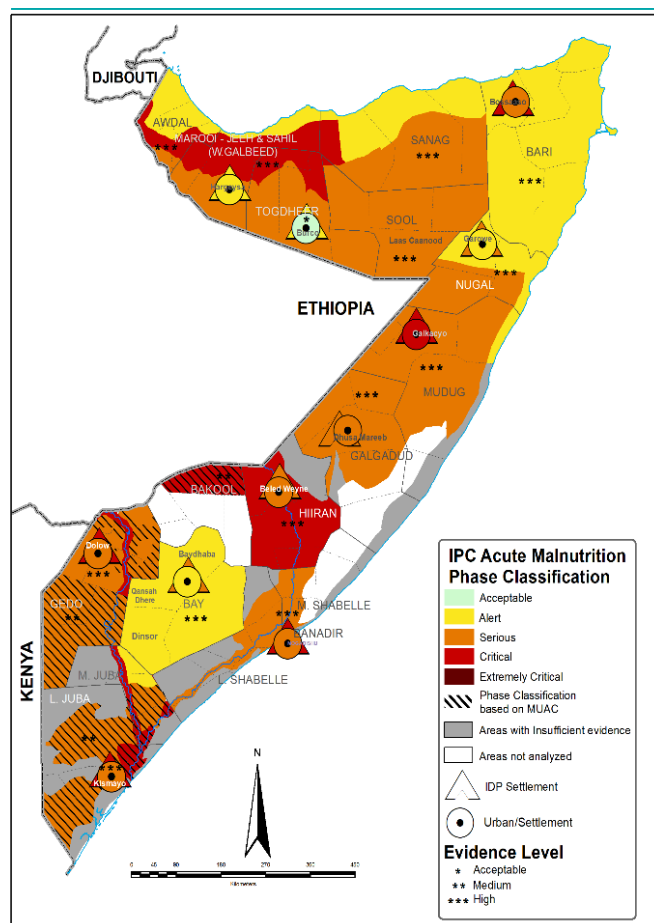

Acute Malnutrition August 2023– July 2024

Bay	226,224	35,930	81,300	117,230	52%
Bakool	98,499	11,840	33,600	45,440	46%
Gedo	176,847	13,270	58,840	72,110	41%
M. Juba	71,254	8,460	26,810	35,270	49%
L. Juba	209,959	19,130	60,250	79,380	38%
Banadir	574,886	87,790	229,730	317,520	55%
TOTAL	3,391,053	330,630	1,120,640	1,451,270	43%

- The trend in the total acute malnutrition burden in Somalia (i.e. total number of children facing acute malnutrition over a 12-month period) is increasing
- Current and projected levels of acute malnutrition in Somalia remain high despite some declines observed since the beginning of 2023

Key Drivers

- Climatic Shocks and Hazards: Below average Gu season rainfall in central and parts of southern Somalia, early cessation of Gu rains in agropastoral areas, flooding in Gedo and Hiran; anticipated El Nino-induced flooding, especially in riverine areas; extended impact of multi-season drought in pastoral areas, including low milk availability and access

- Limited household access to food due to income constraints and elevated food prices

- Conflict: Continued insecurity and conflict in many parts of central and southern Somalia and in Lasanood (Sool region)

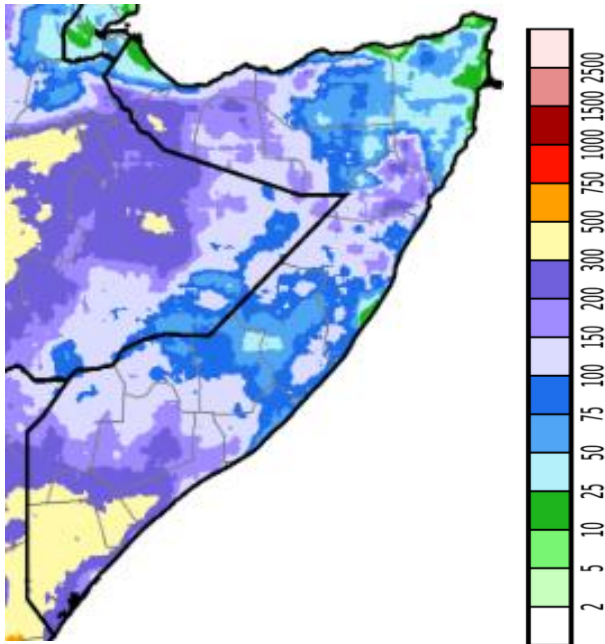

- Diseases and Poor Access to Services: Acute watery diarrhea and measles cases, low access to safe water and sanitation facilities, high morbidity in many areas, low vitamin A supplementation and measles vaccination coverage

1.2.3

- Humanitarian Assistance: Low coverage of and access to humanitarian assistance (nutrition and food security)

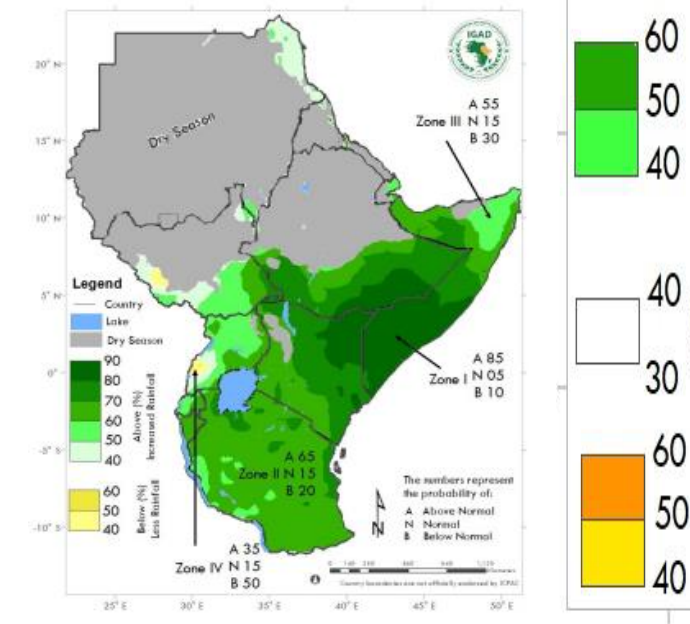

CHIRPS 2023 Gu (April-June)
Rainfall Totals (mm)

CHIRPS 2023 Gu (April-June)
Rainfall Anomaly (mm)

ICPAC/GHA COF65 2023 Deyr (Oct-Dec)
Rainfall Probabilistic Forecast

- In the April-June 2023 Gu season, rainfall began on time or early across most regions, showing variable intensity and distribution. Rainfall withdrew earlier than usual for most areas in May.
- Northern areas and parts of the South (southern Gedo and Lower Juba) experienced average to above-average rainfall, while the central regions had near-average to average rainfall.
- In contrast, major parts of southern regions (Hiran, Bakool, Bay, Middle Shabelle and Lower Shabelle) had less rainfall than usual during this time. However, early rains in March have mitigated this in agropastoral and pastoral areas of Bay, Bakool, parts of Lower Shabelle.
- In July and August 2023, *Hagaa* in southern coastal and adjacent livelihood zones and */Karan* rains in the Northwest performed below-average

January-July 2023 (Actual)

- Somali Shillings are generally stable amid increased dollarization in most markets.
- Prices of maize and sorghum in July have declined to levels below last year and are currently close to average, due to increased supply from current *Gu* production.
- Imported food prices have become stable or decreased over the past one year in most markets due to ample supply but prices remained higher than the five-year average.
- Increased sorghum and maize imports from Ethiopia due to low stocks in Somalia. Re-exports of rice and sugar and livestock trade have also increased in the reference period.
- A modest decrease in the Consumer Price Index due to decreasing food prices in the Minimum Expenditure food basket leads to reduced inflation.

Market Price Trends

August-December 2023 (Outlook)

- GDP growth is projected to be 2.8% in 2023 and 3.5% in 2024, driven by private consumption and external demand
- Staple foods prices are expected to trend near average levels between July and Dec 2023 due to improved cereal supply from current *Gu* season production as well as expected near-average production in *Deyr* 2023 followed by expected above-average off-season harvest.
- Imported food prices are expected to trend near average levels between July and Dec 2023 due to expected record high global production
- Inflation is projected to decrease to 4.2% in 2023 and 4.0% in 2024 as supply chains stabilize. (AFB)
- WTI crude futures forecast a slight increase in Oil prices due to expectations of reduced supply from OPEC countries.

Southern Somalia

Trends in Gu Plus Offseason Cereal Production (1995-2023)

- The 2023 Gu season cereal production in southern of Somalia is estimated at **85 400 tons**, including off-season harvest of **10 700 tons** expected in late Sep/early Oct 2023.
- The above production estimate is **34%** below the long-term average for 1995-2022 but the highest since 2018 Gu.
- Main reasons for the below average production in 2023 Gu are: moisture stress and long dry spells, low river levels that affected irrigation in riverine areas, floods in some riverine areas, high cost of farm inputs and civil insecurity that disrupted crop cultivation.

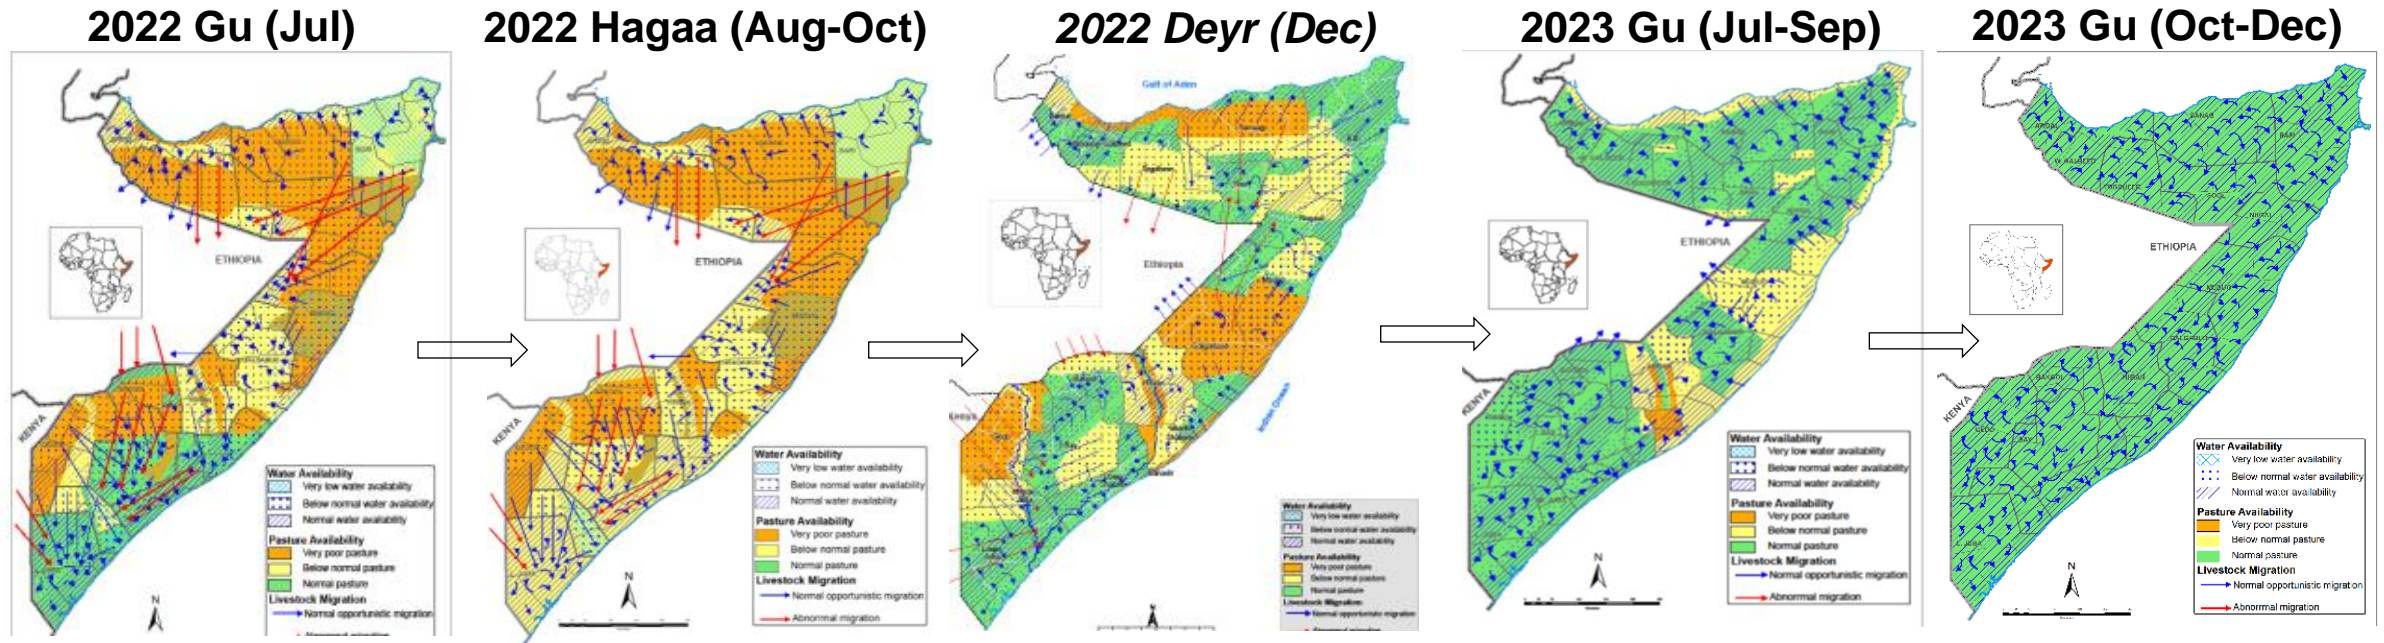

Northwest Regions

Gu/Karan Cereal Estimates (2010-2023)

- The preliminary estimate for the 2023 Gu/Karan cereal production (harvest expected in November) is only **14 400 tons**. This is **60%** lower than the 2010-2022 average. The causes of this poor harvest include late sowing, dry spells in June, expensive inputs, pests and low Karan rainfall.
- Unlike other agro pastoral areas in W. Galbeed and Awdal regions, Togdheer agro pastoral is expected to have a good harvest, thanks to the beneficial effects of early rains and flash floods from the Golis mountains.
- The production of fodder in Togdheer also increased, which boosted the income of poor agropastoral households.

Impact on Pasture and Water Availability and Livestock Production/Reproduction

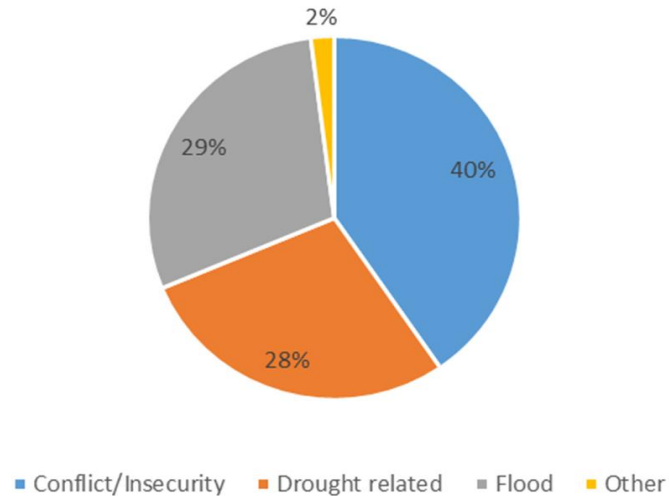

- Rangeland condition showed marked improvement during the 2023 Gu season, signaling the end of drought conditions in most parts of Somalia. Further improvements are expected between October to December and beyond, due to the anticipated above average rainfall.
- Some areas still reported below average pasture and water, especially in Central, Galgadud, south Mudug, the Coast, parts of north Mudug, Hiran and Middle Shabelle regions.
- The extended impact of multi-season drought continued to affect livestock reproduction rates during the 2023 Gu season despite improvement in rangeland conditions.
- Most animals have not been able to conceive or have had miscarriages or stillbirths because of the lack of water and pasture.
- This has reduced the livestock population and the income of pastoralists who depend on them.

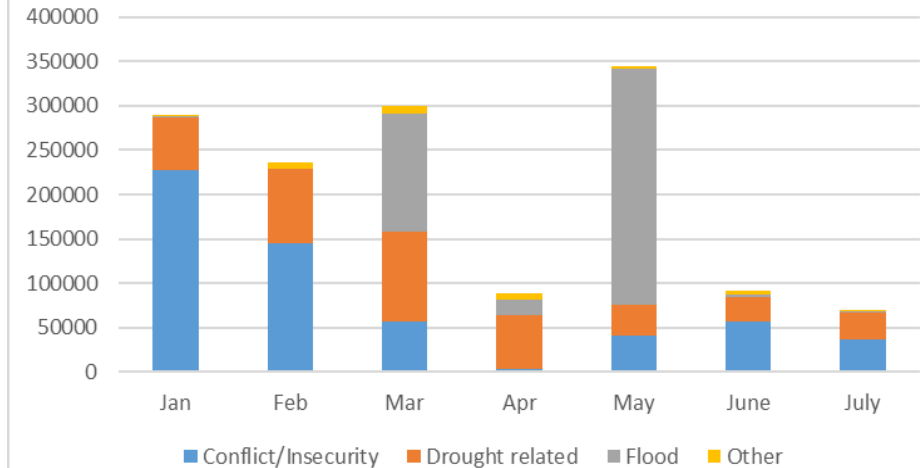

Population Movement and Insecurity

- Based on UNHCR/PRMN data, approximately 1.4 million people were displaced between January to July 2023, mainly due to insecurity/conflict (40%), floods (29%) and drought (28%).
- Most of the insecurity-induced displacements occurred in the months of Jan, Feb, March and May due to government offensive against insurgents in Hiran, Middle Shabelle and Galgaduud regions and due to the ongoing conflict in Laasanood (Sool region).
- Floods caused displacement during March-May in Hiraan and Gedo
- Insecurity/conflict, drought and flood related displacements have contributed to lower crop production in Hiran, Middle and Lower Shabelle regions and restricted livestock migration options (Hiran, Galgaduud)
- Conflict/Insecurity and flood related displacements are expected to continue through the end of 2023, further exacerbating food insecurity across many parts of Somalia, mainly in the South/central and Sool region of North.

Main Reasons for Displacement

UNHCR-PRMN population displacement (Jan-July 2023)

Displacement by region of departures and arrivals (Jan-July 2023)

- Humanitarian assistance (food and cash but also others) has continued to play a critical role in preventing worse food security and nutrition outcomes in many areas
- The severe funding shortages have already forced humanitarian partners to scale down their response prioritizing the most vulnerable in areas with the greatest severity of needs.
- Humanitarian assistance is expected to decline further between October to December 2023 if additional funding is not secured.

Humanitarian Assistance

- 363,914 children (0-59 month) with severe acute malnutrition treated; 799,665 children with moderate acute malnutrition reached
- 305,603 moderately malnourished pregnant and breastfeeding women were reached
- Only 37 of the 74 districts receiving Blanket Supplementary Feeding Programmes, with a focus on food insecure/vulnerable
- Overall, 2.4 M people reached with WASH services (sustainable water supply: 1.1 M; emergency water supply 1.4 M, improved sanitation services: 446,000; hygiene kits and hygiene promotion: 1.7 M)

Projected Nutrition response: (Sept – Dec 2023):

- Sustain treatment of severe and moderate acute malnutrition. Sufficient nutrition supplies are available and no stockout is projected.
- Due to funding shortage, BSFP will be stopped in September 2023, across the country; there are Plans to distribute High Energy Biscuits (HEB) as a replacement for BSFP for those in an acute emergency e.g. flood affected.
- Construction and rehabilitation of shallow wells and boreholes, latrines, and provision of emergency water through water trucking

Key Recommendations

Anticipatory/ Early Action

Provide timely multi-sectoral support to vulnerable communities in riverine areas to mitigate the potential adverse impact of El Nino-related flooding during the Oct-Dec Deyr rainy season

Lifesaving Humanitarian Response

Urgent funding is required for multi-sectoral humanitarian assistance for Food Security, Nutrition, Health and WASH programmes.

Treatment for children, pregnant and breastfeeding women suffering from acute malnutrition

Livelihood Support

Livelihoods support is required for populations that are classified in Stressed or worse (IPC Phase 2 or higher)

Expand Access to Health Services

Strengthen the access to preventative services, with a focus on immunization, micronutrient supplementation, treatment of childhood diseases, and access to clean water and hygiene services.

Social Protection Programmes

Expand social protection programmes in both urban and rural areas to address predictable needs

Scale-up social protection programs targeting the most vulnerable and at-risk households

Improved Aid Delivery

Improved targeting of humanitarian assistance to ensure assistance is reaching the people most in need, including marginalized communities and inaccessible locations.

There is a need for an enhanced area-based integrated strategy that combines sectoral interventions to improve humanitarian outcomes in order to leverage efforts and maximize impact.

Close collaboration between humanitarian and development actors (HDP Nexus approach) is needed to support diverse and layered livelihood-based interventions that tackle the underlying causes of food and nutrition insecurity

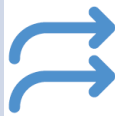

Durable Solutions

Somalia needs a balanced two-pronged approach that combines both addressing immediate humanitarian needs and investment in early recovery and resilience programming.

Strengthen early warning and anticipatory actions and investment in climate-resilient agriculture and food systems to enhance households' capacity to mitigate risks and shocks

Concerted efforts must be exerted to address insecurity, conflict and protracted population displacement

The following risk factors need to be closely monitored throughout the projection period:

	2023 <i>Deyr</i> season rainfall performance and likely impacts on crop and livestock production, including pasture and water availability, livestock body conditions, births, and milk availability
	Food insecurity among displaced and other vulnerable population groups
	Food prices, water prices, livestock prices, wage rates, and terms of trade
	Insecurity and conflict and likely impacts on food security and nutrition
	Population displacement due to flooding and conflict/insecurity
	Admission of acutely malnourished children to treatment and feeding centers
	Disease outbreaks, including AWD/cholera and measles
	Immunization and vaccination coverage
